

BUDGETBASICS

A Simple Website for Everyday Money Planning

PROJECT DOCUMENTATION

TEAM NAME	Code Warriors
TEAM MEMBERS	Zain-ul-Abdin Mubeen Ahmed Razique Nazar Ali Raza
SUBMITTED TO	Teacher Sajjad Chandio

01 | Introduction

BudgetBasics is a beginner-friendly budgeting website concept. It presents a simple digital space for recording income and expenses, viewing a spending overview and building everyday money-planning habits.

02 | Purpose of the Project

The project aims to make basic budgeting easier to understand. Clear labels, uncomplicated forms and organized information help users follow where money comes from and where it goes.

03 | Intended Website Experience

A visitor starts on the homepage, learns what BudgetBasics offers and moves into the budgeting area. A simple layout can organize income entries, expense entries and a summary. The website should explain each step in everyday language.

04 | Main Interface Sections

Homepage: Introduces the project and its purpose.

Income and expenses: Provides clearly labeled areas for entering amounts and descriptions.

Budget overview: Presents totals and a readable summary of the information entered.

Guidance: Explains basic budgeting ideas for new users.

05 | Technologies Used

HTML: Defines the website structure, including forms, headings, labels and summary areas.

CSS: Styles the layout, typography, spacing, buttons and mobile presentation.

JavaScript: Handles interactive behavior, validates user input and calculates or updates totals where implemented.

06 | Design Approach

The design prioritizes readability and clarity over decoration. Consistent cards, visible headings and enough spacing between fields make the interface approachable. A responsive layout allows the same information to remain useful on different screen sizes.

07 | Development Workflow

First, plan the content and page structure. Next, create the HTML pages and forms. Apply CSS for consistent styling, then use JavaScript to connect controls to visible results. Review the complete visitor journey before finalizing the project.

08 | Testing Checklist

Check navigation, form labels, amount entry and calculations. Make sure invalid or empty inputs are handled clearly, totals update correctly where applicable, and the layout works on both phones and computers.

09 | Possible Future Improvements

Later versions could add expense categories, savings goals, visual summaries or optional data persistence. These are ideas for future development and are not presented as completed features.

10 | Conclusion

BudgetBasics demonstrates how HTML, CSS and JavaScript can support a useful financial-planning website. Its focus is straightforward presentation and understandable interaction rather than complex functionality.
